

AnfieldVoice

Intelligent Visitor & Communication
Management for Residential Estates

Secure • Efficient • Built for Estates

Prepared for: Body Corporate & Estate Management

Date: July 2026 | **Confidential**

Red Cape Technologies (Pty) Ltd

Reg: 2022/762895/07

The Problem

Every day, the same domestic workers, school transport, deliveries, and visitors queue at the gate. Security treats every arrival as if they've never been before. Residents get calls about people they approved yesterday. No one has a complete record of who entered or when.

15-25h

Security phone time per week

60-70%

Security on the phone, not the gate

50-80

Verification calls to residents daily

8-15

Vehicles queued at morning peak

The cumulative cost is substantial: security staff hours lost to phone calls, resident time wasted on repeated verification, gate congestion during peak hours, liability from undocumented deliveries, and resident dissatisfaction — consistently a top-3 complaint in body corporate surveys.

Solution Overview

AnfieldVoice replaces the estate intercom, visitor logbook, delivery register, and resident phone directory with a single, integrated platform. Every arrival, every call, every access decision is recorded, searchable, and attributable.

How It Works

1. Resident Authorises a Visit

Using the AnfieldVoice mobile app, a resident creates a Visitor Ticket. The system generates a one-time PIN valid for today's date only. The resident shares this PIN with their visitor.

2. Visitor Arrives at the Gate

The visitor enters their PIN at the weatherproof touchscreen terminal. The system instantly retrieves their ticket and displays it on the Security Dashboard.

3. Security Verifies and Admits

The security officer sees the ticket details — visitor name, vehicle, resident who authorised them — and visually confirms. If everything matches, admission takes seconds.

4. Audit Trail Created

Every step is logged immutably: ticket creation, PIN validation, admission decision, officer identity, and any exceptions. Available to administrators and never expires.

What Changes

Before	After AnfieldVoice
Every visitor processed from scratch	Recurring visitors: 10-15 seconds at gate
Handwritten gate logs or nothing	Complete searchable digital audit trail
Residents interrupted 50-80 times daily	~70% fewer verification calls
Deliveries create phone calls and liability	Every delivery logged, tracked, resolved
Morning queue: 8-15 vehicles	Morning queue: 2-5 vehicles

Visitor Management Workflows

1. Standard Visitor (One-Time)

Resident creates ticket in app → **System** generates one-day PIN → **Visitor** enters PIN at gate terminal → **Security** verifies and admits → Everything logged.

Total time: ~20-30 seconds from PIN entry to admission.

2. Recurring Visitor (Daily — Domestic Worker, School Transport)

Resident taps saved profile → "Generate Today's PIN" (5 seconds) → **Visitor** enters PIN → **Dashboard** shows "Verified Profile" badge → **Security** quick admit.

Total time: ~10-15 seconds. No phone call needed. Profile created once, used every day.

3. Unexpected Visitor (No PIN)

Visitor has no PIN → **Terminal** calls resident via mobile app → **Resident** answers and issues a PIN → Standard admit. **No answer? Visitor is not admitted.**

Event is logged as "Unexpected — No PIN — No Resident Response".

4. Delivery Management

Driver arrives at gate → **Dashboard** shows resident's pre-approval (Accept / Hold at Gate / Redirect) → Delivery logged with driver details, time, resolution.

No more "we have a package for apartment X" phone calls. Every delivery is accounted for.

Security Architecture — Six Layers of Verification

AnfieldVoice is designed on a defence-in-depth model. No single component failure or compromise can grant unauthorised access to the estate or resident data.

Layer 1 — Resident Authorisation

Every visit begins with an explicit resident action: creating a ticket and generating a PIN. No visitor can be processed without prior resident authorisation.

Layer 2 — Time-Bound PIN

PINs are valid for today's date only. Expired PINs are rejected automatically. The resident sets the validity window (default: 24 hours). Yesterday's PIN will not work today.

Layer 3 — Ticket Retrieval

When a PIN is entered at the gate, the system retrieves exactly one ticket — for one visitor, on one day. If the ticket does not exist or has been revoked, access is denied.

Layer 4 — Security Officer Verification

The security officer reviews the ticket details — visitor name, vehicle, category — and visually confirms the visitor before admission. The officer's identity is recorded.

Layer 5 — Exception Handling

If any detail does not match (wrong vehicle, different person, unexpected time), the officer can call the resident directly from the dashboard. No admission without resolution.

Layer 6 — Complete Audit Trail

Every decision is logged immutably: who created the ticket, when the PIN was used, which officer processed the visitor, the admission decision, and any exceptions.

Data Protection

- All resident data encrypted in transit and at rest
- All administrative actions are logged and auditable
- PINs are one-way hashed — never stored in plaintext
- POPIA-compliant data handling with configurable retention policies
- Database access is restricted and audited
- Regular automated security updates for all systems

Access Control — Who Can Do What

Roles are additive — a person can be a resident AND a property administrator. But a non-resident property administrator never receives resident-only privileges.

Function	Resident	Property Admin (Lives Here)	Property Admin (Remote)	Body Corp
Receive gate calls	✓	✓	✗	✓
Generate visitor PINs	✓	✓	✗	✓
Add / remove tenants	✗	✓	✓	✓
Activate / suspend residents	✗	✓	✓	✓
View apartment activity	Limited	✓	✓	✓
Estate administration	✗	✗	✗	✓

Design Principles

Non-resident PA never appears as occupant

A letting agent managing 20 apartments should never receive gate calls or generate PINs for those units. They manage the tenancy — they don't live there.

Roles are additive, not exclusive

A resident who owns their unit can be both Resident and Property Admin. A security officer can also be Maintenance. No forced choices.

Platform Components

Resident Mobile Application

- Create one-time or recurring visitor tickets with PIN generation
- Manage recurring visitor profiles for rapid daily authorisation
- Delivery management — approve, redirect, or deny deliveries
- Voice and video calling to security, neighbours, and estate management
- Searchable directory of consenting residents
- Push notifications for visitor arrivals, deliveries, and estate announcements
- One-touch emergency call to security or emergency services

Visitor Terminal

- Weatherproof touchscreen interface at the estate gate
- PIN entry for visitor ticket validation
- Resident search by name or apartment number
- Direct SIP call to resident's mobile app
- Customisable welcome screen with estate rules

Security Dashboard

- Real-time ticket queue with colour-coded status indicators
- Admit / Deny controls with one-click logging
- Recurring Visitor — Verified Profile badge for pre-registered visitors
- One-click resident calling from any ticket
- Searchable audit log of all access events
- Multi-language interface (English, Afrikaans, Zulu)

Administration Portal

- Resident account management and apartment assignment
- Visitor policy configuration (PIN validity, categories, hours)
- Analytics dashboard — visitor volume, peak hours, processing times
- Audit export as PDF or CSV for body corporate meetings
- Estate-wide announcements and communication broadcasts
- Role-based access for administrators and committee members

What You Get

After the deposit is paid, your system is installed and operational within **2-3 weeks**.

Hardware Included

- **1x Server** — on-site, pre-configured, all software installed and ready
- **3x Tablets** — for security dashboards at the gate and guard house
- **2x Number Pads** — weatherproof, outdoor-rated for the visitor terminal

Services Included

- **Full installation** — on-site setup, network integration, configuration
- **Security staff training** — hands-on dashboard and workflow training
- **Resident onboarding** — app setup support, instruction materials
- **Go-live support** — on-site during the first week of operation

Benefits & ROI

Quantitative Impact (360-Unit Estate)

Metric	Improvement
Gate processing — standard visitor	~60% faster
Gate processing — recurring visitor	~80% faster
Resident verification calls	~70% reduction
Security staff phone time	~75% reduction
Morning peak queue length	~60% reduction
Undocumented deliveries	~95% reduction

Qualitative Benefits

- Improved resident satisfaction — fewer interruptions, faster gate processing
- Enhanced security posture with layered verification and full audit trail
- Professional estate image — branded app and modern visitor terminal
- Security officers focus on security duties, not phone calls
- Body corporate transparency — data-driven reports for meetings
- Reduced liability — documented access decisions for disputes and insurance

About Red Cape Technologies

Red Cape Technologies builds practical security and communication systems designed from the ground up for South African residential estates. We do not resell generic products with a custom label — every component is purpose-built for estate living, from the visitor ticketing workflows to the security dashboard and administration portal.
